Intelligent ventilation technology must become the norm! And that in the truest sense of the word. "School and ventilation" is therefore also the main topic of the new TROX life, which has just been published.

Efficient and sustainable learning is the basis for good (school) education. Various framework conditions play an important role in this: the architectural design of the learning environment, but also the indoor climate and ventilation in particular.

Nevertheless, teachers and students can only dream of minimum air quality standards in many places. While in other countries, especially in Scandinavia, good air quality was already achieved in a large part of schools years ago, practically nothing has happened in Germany - although corresponding minimum requirements for mechanical school ventilation systems exist. In the new issue, you can read about this in an interview with Professor Geo Clausen from Denmark, one of the most renowned researchers in the field of school ventilation.

We also present our new SCHOOLAIR-S-HV floor-standing unit. Delivered ready for connection, it can be positioned on any wall, is quick and easy to install, and is very efficient thanks to its high air performance and heat and moisture recovery.

We also report on the Indoor-Air trade fair in Frankfurt. There, on the initiative of the Heinz Trox Foundation, a much-noticed symposium took place on the topic of Indoor Air Quality. And we entertain you with unusual, curious and interesting facts about schools.
